

THREAT ADVISORY

**ATTACK
REPORT**

**Raspberry Robin worm infects Multiple Windows
Network Devices**

Date of Publication

July 14, 2022

Admiralty Code

A2

TA Number

TA2022147

Summary

The Raspberry Robin worm spreads via USB devices and shared folders to infect Windows installers and QNAP devices using compromised QNAP devices as stagers. Majority of the victims in Europe are being targeted.

Potential MITRE ATT&CK TTPs

TA0001 Initial Access	T1091 Replication Through Removable Media	TA0002 Execution	T1059.003 Command and Scripting Interpreter: Windows Command Shell
TA0005 Defense Evasion	T1218.008 System Binary Proxy Execution: Odbcconf	T1218.011 System Binary Proxy Execution: Rundll32	T1218.007 System Binary Proxy Execution: Msiexec
TA0011 Command and Control	T1071.001 Application Layer Protocol: Web Protocols	T1055 Process Injection	T1112 Modify Registry
T1548.002 Abuse Elevation Control Mechanism: Bypass User Account Control	T1574.001 Hijack Execution Flow: DLL Search Order Hijacking	TA0003 Persistence	T1574.002 Hijack Execution Flow: DLL Side-Loading

Technical Details

#1

Raspberry Robin worm spreads specifically through USB devices that contain Microsoft LNK files which infects the windows device using the command prompt via the creation of a `msiexec.exe` process. After gaining initial access, the malware establishes persistence by booting at each system startup. The LNK file contains commands for the Windows shell, and another file containing padding data serves as the BAT file.

#2

When an external connection is successful, the `msiexec.exe` file is downloaded and installs a malicious.DLL on the compromised system. `Rundll32.exe` then launches a legitimate Windows utility to execute the malicious.DLL file.

#3

The worm is more difficult to detect because it uses process injection to hide malicious activities under three processes in the Windows system, and the malware's infrastructure communicates via TOR exit node.

✂ Indicator of Compromise (IOC)
