Technical Details

#1

It begins with the attacker already having Domain Admin access and staging their ransomware payload. Most ransomware operators develop a preferred method of deploying and executing their payloads. However, multiple approaches were used to install this ransomware in different victim scenarios.

#2

Upon installation, the Prestige ransomware drops a ransom note named “README.txt” in the root directory of each encrypted drive. Prestige uses the CryptoPP C++ library to encrypt each eligible file using AES as part of its encryption procedure. It then deletes the backup catalog to prevent data recovery.
