

# Release Notes

Uni5 Xposure v6.9.9, v6.9.10

## Platform Enhancements

- Added an **Asset Name** parameter to both the **Assessment Vulnerability** and **Assessment Misconfiguration** list and detail views. The backend now provides both *Asset Name* and *Hostname* — the system will display the **Asset Name**, and if it's null, it will automatically use the **Hostname** as a fallback.
- Added a “**View Live Data**” option across all **Assessment Views** for *Vulnerabilities*, *Misconfigurations*, and *Assets*. Users can now click this option to instantly access live, filtered views for real-time visibility and analysis.
- Enhanced the **Vulnerability Watch** section with improved visibility and interactivity:
  - Displaying the **exact number** of vulnerabilities identified in the watch area (no rounding).
  - Added **three additional counts** – *Open*, *Reopen*, and *Closed* vulnerabilities.
  - **Removed** the *Scans* label for cleaner visualization.
  - Made all numbers **clickable**, redirecting users to the filtered *Vulnerability List View*.
  - Added a **Date Range filter**, allowing users to select a custom range to filter vulnerability data dynamically.
- Enhanced the **Misconfiguration Watch** section with improved visibility and interactivity:
  - Displaying the **exact number** of misconfigurations identified in the watch area.
  - Added **three additional counts** – *Compliant*, *Non-Compliant*, and *Inconclusive*.
  - **Removed** the *Scans* label for a cleaner layout.
  - Made all numbers **clickable**, redirecting users to the filtered *Misconfiguration List View*.
  - Added a **Date Range filter**, allowing users to select a custom range to filter misconfiguration data dynamically.
- Implemented **Role-Based Access Control (RBAC)** on the **Master App**, similar to the Uni5 single-tenant setup, allowing administrators to **invite and manage users** directly on the platform.
- Split the **Revalidation** widget on the *Exposure Assessment* → *Overview* dashboard into two separate widgets: “**Revalidation Status – Vulnerabilities**” and “**Revalidation Status – Misconfigurations**”, providing clearer visibility and focused tracking for each category.
- Updated the **Vulnerability Group View** to exclude **closed vulnerability instances**, ensuring the view displays only open and reopen vulnerabilities.
- **UI/UX Enhancement – Change & Reset Password Pages**
  - We've introduced a refreshed design and theme for the Change Password and Reset Password pages, providing a cleaner layout and improved user experience.
- **HVS SSH Credentials** - Added support for specifying a custom SSH port in the credentials used by the HVS agent. Users can now enter a custom port when selecting SSH credentials in the HVS category, with port 22 pre-filled by default.
- Added a new “**Vulnerabilities**” column in the assets table within the assessment detail view to display the number of vulnerabilities detected for each asset. This enhancement provides complete scan scope visibility by listing all assessed assets, including those with zero vulnerabilities.
- Improved the CVE table on the alert detail page to sort CVEs by impacted assets in descending order, prioritizing the most relevant CVEs for users.
- Added "Select All" and "Deselect All" buttons in the Departments section of the agent integration window, allowing users to quickly manage department selections, especially in large environments.

# Release Notes

Uni5 Xposure v6.9.9, v6.9.10

## Platform Enhancements

- **SIEM APIs Enhancement**

The Uni5 Xposure SIEM APIs have been enhanced to support a **configurable records-per-page limit**.

Previously, the APIs were restricted to displaying a maximum of **2,000 records per page**. With this enhancement, users can now configure this limit to any desired value.

**Configuration Steps:**

To enable this feature, execute the following database query: `INSERT INTO`

`public.system_settings (key, value) VALUES ('siem.max-page-size', '5000');`

Here, the value **'5000'** is configurable and can be set to any preferred number.

**Usage:**

Once configured, specify the desired page size in the API request using the **size** query parameter:

`?size=5000`

This will increase the number of records returned **per page** in the API response to the configured value. This enhancement provides greater flexibility and control over data retrieval, especially for high-volume queries within the SIEM APIs.

## Integration Updates

- Manage Engine Vulnerability Management Plus (MEVMP) integration has been developed and added to Uni5
  - This integration is for both Asset sync and Vulnerability as well as Misconfiguration sync from MEVMP
  - The integration needs the following for the connection to work
    - URL of the MEVMP instance,
    - The user name and password for authentication
  - **Please note** - The asset sync will pull inactive machines where agent was installed earlier and also, machines where the agent installation failed due to some reason
- Manage Engine Service Desk Plus (MESDP) enhancement to support custom templates
  - MESDP integration config set up now asks the user to give the name of the custom template in MESDP to send the tickets in MESDP.
  - The idea is to have the required/mandatory fields as part of this custom template
  - This removes the need to keep standard fields in the default template in the Requests (Incidents) module of MESDP

# Release Notes

Uni5 Xposure v6.9.9, v6.9.10

## Bug Fixes

- Fixed an issue where **inline filters on the Asset List View** stopped working after searching for a non-existent Asset ID.
- Fixed an issue in the **Tickets** module where the **Asset Department** filter was not functioning correctly.
- Fixed an issue where the **Installed Software** and **Services** filters were not working properly on both the **Asset Detail** and **Asset List** pages.
- Fixed issue of **Web Application infra definition not showing after selection of web application** while launching scan using Hwas or Burp Pro tool.
- Ticket re-assigned for individual tickets was broken - this is now fixed. Re-assignment of tickets works well now.
- When the job to transfer tickets was failing , the job status was showing up as successful, this is fixed now
- The ticket bulk transfer job was showing as "Scan/Sync in progress" - this text has been corrected
- Fixed an issue in **Exposure Assessments** → **Configurations** → **Credentials** where the search functionality was not filtering results correctly. Previously, entering a valid search keyword displayed "No data found" even when matching credentials existed. The search now works as expected, dynamically displaying relevant credential entries based on the entered keyword.
- Resolved an issue where large-range HVS scans failed to complete and return results due to duplicate credentials being created during parallel partitioned scans of 4000 IP chunks.
- Addressed scan failures in multi-tenant systems when run via outbound agent, caused by the lack of unique identifiers for the outbound agent across different tenants.
- Resolved connection issue with Ivanti Patch Manager integration from Uni5, where the backend was throwing errors despite the API working correctly in Postman.
