# Summary

HiveForce Labs has reported a striking surge in global cyber threats, underscoring how attacks are not only growing in number but also in complexity. In just one week, we detected **seven** major attacks, tracked **four** active threat actor groups, and confirmed the active exploitation of **four** vulnerabilities. This rapid escalation highlights an increasingly volatile landscape where attackers relentlessly probe for weak points, from exposed systems to minor misconfigurations, to secure a foothold in targeted environments.

Among the most critical findings, attackers are actively exploiting three major flaws, **CVE-2024-9234**, **CVE-2024-9707**, and **CVE-2024-11972**, in the GutenKit and Hunk Companion WordPress plugins, enabling full site compromise through malicious plugin installations and remote code execution. Meanwhile, **Qilin (Agenda)** ransomware has emerged as one of 2025's most aggressive operations, amassing over 700 victims, including nearly 200 in October alone. This surge reflects an alarming rise in the scale and tempo of ransomware activity, with threat actors accelerating their attacks across industries and geographies.

Nation-states and financially motivated actors are also intensifying their operations. **Transparent Tribe (APT36)** has been targeting Indian military and government entities using spear-phishing emails to deploy **DeskRAT**, a Golang-based remote access tool tailored for Linux systems. In parallel, **CL-CRI-1032's** Jingle Thief campaign exploits Microsoft 365 environments for large-scale gift card fraud via phishing and smishing lures. Elsewhere, **SideWinder** is spearheading a stealthy espionage campaign across Asia, using fake Adobe Reader updates to deliver ClickOnce-based payloads, while Vietnam's **UNC6229** deceives marketing professionals through fraudulent job listings. Collectively, these operations serve as a stark reminder that cyber resilience now hinges on proactive defense, timely patching, and unwavering vigilance in an era of relentless digital warfare.

# Insights

**APT36** pivots to Linux espionage with **DeskRAT**, blending deception, persistence, and precision against Indian defense networks.

The **Jingle Thief campaign** turns Microsoft 365 into a gift card goldmine through relentless phishing and smishing.

**Qilin**, aka **Agenda**, cements its place as **2025's** most aggressive ransomware, claiming **700** victims and counting.

**SideWinder** lures officials with bogus Adobe Reader updates, a **ClickOnce** trap masked as diplomatic paperwork.

Mass exploitation of **CVE-2024-9234**, **CVE-2024-9707**, and **CVE-2024-11972** enables remote code execution and silent website takeovers.

**UNC6229** turns career dreams into cyber traps, luring digital marketers with fraudulent job postings.

| <a href="#">DeskRAT</a> | DeskRAT is a custom Golang-built Remote Access Trojan engineered to compromise Linux environments with surgical stealth: it chains dropper scripts, convincing decoy PDFs, and multiple Linux-specific startup mechanisms to gain persistent, long-term access, quietly exfiltrate files, and maintain remote control. Notably tailored to target systems running the BOSS Linux distribution, widely used within some Indian government organizations, DeskRAT blends social-engineering lures with platform-aware persistence tricks to evade detection and ensure the attacker’s foothold endures. | Spear-phishing attacks | -                                       |

| <a href="#">ModuleInstaller</a> | ModuleInstaller is a stealthy downloader that establishes and sustains an attacker's foothold on compromised systems: it retrieves configuration files that tell it which components to fetch, usually a seemingly legitimate application alongside a malicious DLL, and then uses that DLL as the loader for the final-stage payload, enabling persistent execution and further payload delivery. | Phishing            | -                |

| <u>StealerBot</u> | StealerBot is a private post-exploitation toolkit, designed for espionage and stealthy data theft. Developed in .NET, it operates as a modular implant, avoiding traditional file-based execution by loading its components directly into memory via ModuleInstaller, a backdoor loader named by the attackers. StealerBot features multiple modules for deploying additional malware, capturing screenshots, logging keystrokes, stealing browser passwords and files, phishing Windows credentials, and escalating privileges by bypassing UAC, making it a versatile tool for persistent access and data exfiltration. | Phishing                      | -                |

| <u>Qilin Ransomware</u> | Qilin, also known as Agenda, is a prolific Ransomware-as-a-Service operation that supplies its encryption toolkit to affiliate actors, who commonly employ double-extortion tactics: they both encrypt victims’ files and steal sensitive data to threaten public release unless a ransom is paid. Beyond the usual RaaS playbook, a major 2025 evolution lets affiliates run a Linux ransomware variant on Windows hosts by abusing legitimate remote-management and file-transfer tools such as AnyDesk, ScreenConnect, and Splashtop; this cross-platform trick evades many Windows-focused detection controls and improves stealth inside mixed-OS environments, making Qlin/Agenda attacks harder to spot and more damaging when they succeed. | Phishing                         | -                 |
|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | IMPACT                           | AFFECTED PLATFORM |

| <a href="#">Hijackloader</a> | Hijackloader is a stealthy loader first seen in July 2023 that serves as a delivery platform for a variety of follow-on malware; it combines sophisticated evasion and abuse of Windows internals, using Process Doppelg nging to run from altered in-memory images, Heaven’s Gate to flip between 32- and 64-bit contexts, and DLL search-order/DLL side-loading tricks so attacker libraries are loaded instead of legitimate ones, making detection and forensic analysis difficult. | Phishing             | -                 |
|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | IMPACT               | AFFECTED PLATFORM |

| <u>LeetAgent</u> | <p>LeetAgent is the spyware deployed in the Operation ForumTroll campaign; its name reflects the quirks of the codebase, where command names are written in leetspeak. The implant reads a configuration to contact one of several hardcoded C2 servers over HTTPS, then receives numeric command identifiers it maps to actions and executes them remotely.</p> <p>Built-in traffic-obfuscation options and a polished command/response design suggest LeetAgent may be a commercial or commoditized tool.</p> | Exploiting Vulnerability                                                                                                                                                                      | CVE-2025-2783    |
|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | IMPACT                                                                                                                                                                                        | AFFECTED PRODUCT |

# Recommendations

## Security Teams

This digest can be utilized as a drive to force security teams to prioritize the **four exploited vulnerabilities** and block the indicators related to the threat actors **Transparent Tribe, CL-CRI-1032, SideWinder, UNC6229**, and malware **DeskRAT, ModuleInstaller, StealerBot, Qilin Ransomware, Hijackloader, PureHVNC**, and **LeetAgent**.

## Uni5 Users

This is an actionable threat digest for HivePro Uni5 customers, and they can get comprehensive insights into their threat exposure and can action it effortlessly over the HivePro Uni5 dashboard by

- Run a Scan to discover the assets impacted by the **four exploited vulnerabilities**.
- Testing the efficacy of their security controls by simulating the attacks related to the threat actors **Transparent Tribe, CL-CRI-1032, SideWinder, UNC6229**, and malware **DeskRAT, Qilin Ransomware, Hijackloader**, and **PureHVNC**, in Breach and Attack Simulation(BAS).

# Appendix

**Known Exploited Vulnerabilities (KEV):** Software vulnerabilities for which there are public exploits or proof-of-concept (PoC) code available, and for which there is a high risk of potential harm to an organization's systems or data if left unaddressed.

**Celebrity Vulnerabilities:** Software vulnerabilities that have gained significant attention and have been branded with catchy names and logos due to their profound and multifaceted impact. These vulnerabilities provide threat actors with opportunities to breach sensitive systems, potentially resulting in unauthorized access and the compromise of critical information.

## ✂ Indicators of Compromise (IOCs)

| Attack Name             | TYPE   | VALUE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
