Technical Details

#1

The Iranian government-affiliated group DEV-0861 obtained access to an Albanian government victim's network by exploiting the CVE-2019-0604 vulnerability on an unpatched SharePoint Server.

#2

Following the initial access, DEV-0166 was detected exfiltrating mail from the victim using the tool Jason.exe to access compromised mailboxes. The intrusion against the Albanian government employed a familiar method of Iranian state-sponsored actors, releasing ransomware first followed by the deployment of wiper software.

#3

DEV-0842 used an invalid digital certificate from Kuwait Telecommunications Company KSC to sign the wiper used in the cyberattack, which was also used to sign 15 other files.
