Microsoft December 2025 Patch Tuesday Roundup

Date of Publication

December 11, 2025

Admiralty Code

A1

TA Number

TA2025375

Summary

First Seen: December 9, 2025

Affected Platforms: Microsoft Server, Windows Graphics, Windows Update Service, Microsoft Office, Microsoft SharePoint, GitHub Copilot, Chromium, Azure and more

Impact: Information Disclosure, Denial of Service, Remote Code Execution, Elevation of Privilege, Security Feature Bypass, Spoofing

Vulnerability Details

#1

Microsoft's December 2025 Patch Tuesday delivers a significant security update, addressing 57 vulnerabilities across its product ecosystem. Of these, 2 are classified as critical, 54 as important, and 1 as low in severity. The vulnerabilities span multiple categories: 28 elevation of privilege, 19 remote code execution (RCE), 4 information disclosure, 3 denial-of-service, and 3 spoofing issues. Additionally, Microsoft has released patches for 13 non-Microsoft CVEs, bringing the total to 70 vulnerabilities addressed this month. Importantly, 10 of these vulnerabilities are at risk of exploitation, emphasizing the need for immediate patch deployment.

#2

This release centers on a zero-day vulnerability, demanding immediate attention. The most critical is Zero-day tracked as CVE-2025-62221, a privilege-elevation flaw already being exploited. It targets Windows systems running the Cloud Files Mini Filter Driver and can be executed through local, low-privilege access with low attack complexity and no user interaction. Successful exploitation yields SYSTEM-level authority, allowing full control of the affected system.

#3

An attacker can gain an initial low-privilege foothold through phishing, browser-based exploitation, or any existing remote code execution path. Once inside, chaining that access with CVE-2025-62221 enables complete host compromise. With SYSTEM privileges, the attacker can load kernel components, misuse signed drivers to bypass defenses, maintain persistence, and pivot toward domain-wide compromise when paired with credential theft.

#4

Two additional flaws have been publicly disclosed but are not known to be under active exploitation. CVE-2025-54100 is a PowerShell remote code execution vulnerability that lets unauthenticated local attackers run arbitrary code by abusing a command-injection weakness. The threat escalates when folded into routine workflows. A common example is an attacker persuading a user or administrator to execute a PowerShell command using Invoke-WebRequest, allowing a remote server to deliver crafted content that triggers the parsing flaw, resulting in code execution and implant deployment.

#5

CVE-2025-64671 affects GitHub Copilot for JetBrains and introduces a command-injection vector. This flaw can permit remote, unauthenticated execution of arbitrary code. Organizations need to test and deploy these updates through Windows Update or the Microsoft Update Catalog without delay, given the zero-day exposure. Extended Security Updates remain essential for Windows 10 systems after the end of support.

Recommendations

Conduct an extensive service exposure evaluation to identify any vulnerable services that may be publicly accessible. Take immediate and decisive action to address any identified vulnerabilities, either by installing essential [patches](#) or adopting security measures.

Keep your systems up to date by implementing the most recent security updates. To avoid the introduction of new vulnerabilities, follow security rules adapted to unique devices. Furthermore, to strengthen the resilience of devices and apps exposed to the internet, thoroughly review their configurations.

Third-Party Tool Isolation: Contain the exposure introduced by vulnerable development tools, such as Copilot for JetBrains, by isolating them within controlled environments, limiting plugin and extension execution, and validating all command-handling configurations to prevent injection pathways.

Conduct Post-Patch Validation and Testing. After deploying patches, perform thorough testing to confirm that the vulnerabilities have been mitigated and that critical business functions remain operational without disruption.
