THREAT ADVISORY

ATTACK REPORT

**Brazil's manufacturing industry
under attack by Vice Society
ransomware group**

Date of Publication

January 25, 2023

Admiralty Code

A1

TA Number

TA2023045

Summary

First appeared: June 2021

Threat Actor: Vice Society

Attack Countries: Brazil, Argentina, Switzerland, and Israel

Attack Sector: Manufacturing, Government, Finance, Education, and Healthcare

Attack: Vice Society ransomware group is a highly adaptable and persistent threat targeting various industries using various tools, and techniques and is suspected of preparing for Ransomware-as-a-Service operation

Attack Details

#1

The Vice Society ransomware group is a cyber threat group that made headlines in late 2022 and early 2023 for a series of attacks against various targets, including the rapid transit system in San Francisco. They are known to focus on the education and healthcare sectors but have now been targeting the manufacturing sector as well. The group has been using various tools and techniques to carry out their attacks, such as exploiting the PrintNightmare vulnerability, deploying ransomware variants such as Hello Kitty/Five Hands and Zeppelin, and developing their own custom ransomware builder with more robust encryption methods. They are also suspected of preparing for a ransomware-as-a-service operation.

#2

The group's weapon of choice is Cobalt Strike, a hacking tool that allows them to remotely access and control infected endpoints. They also use the Rubeus C# toolset for raw Kerberos interaction and abuse, which is a technique that has been previously used by other ransomware groups. To move laterally within the target network, they use Mimikatz to dump passwords and the Kape tool for copying files.

#3

The group's attack vector is likely to involve the exploitation of a public-facing website or the abuse of compromised remote desktop protocol (RDP) credentials. They execute a PowerShell script to create an administrator account that allows for remote access to other endpoints and terminates several security processes before dropping the custom-built ransomware. They have also been observed removing traces of RDP sessions, a technique that was previously used by Clop ransomware and KillDisk.

Recommendations

Security Leaders

Phishing simulations and routine education and awareness training and communications rarely account for MFA fatigue and web browser hygiene. Integrate and communicate all lessons learned.

Security Engineers

- **Uni5 Users:** This is an actionable threat advisory in HivePro Uni5. Prioritize and block all indicators attributed to the threat actors and attacks through your Command Center. Test your controls with Uni5's Breach & Attack Simulation.
- **All Engineers:** Refer to and action upon the 'Potential MITRE ATT&CK TTPs' & 'Indicators of Compromise (IoC)' on the following pages.
