THREAT ADVISORY

ATTACK REPORT

New GoBruteforcer Malware Targeting Web Servers Running Popular Services

Date of Publication

March 13, 2023

Admiralty Code

A1

TA Number

TA2023130

Summary

First appeared: July 2022

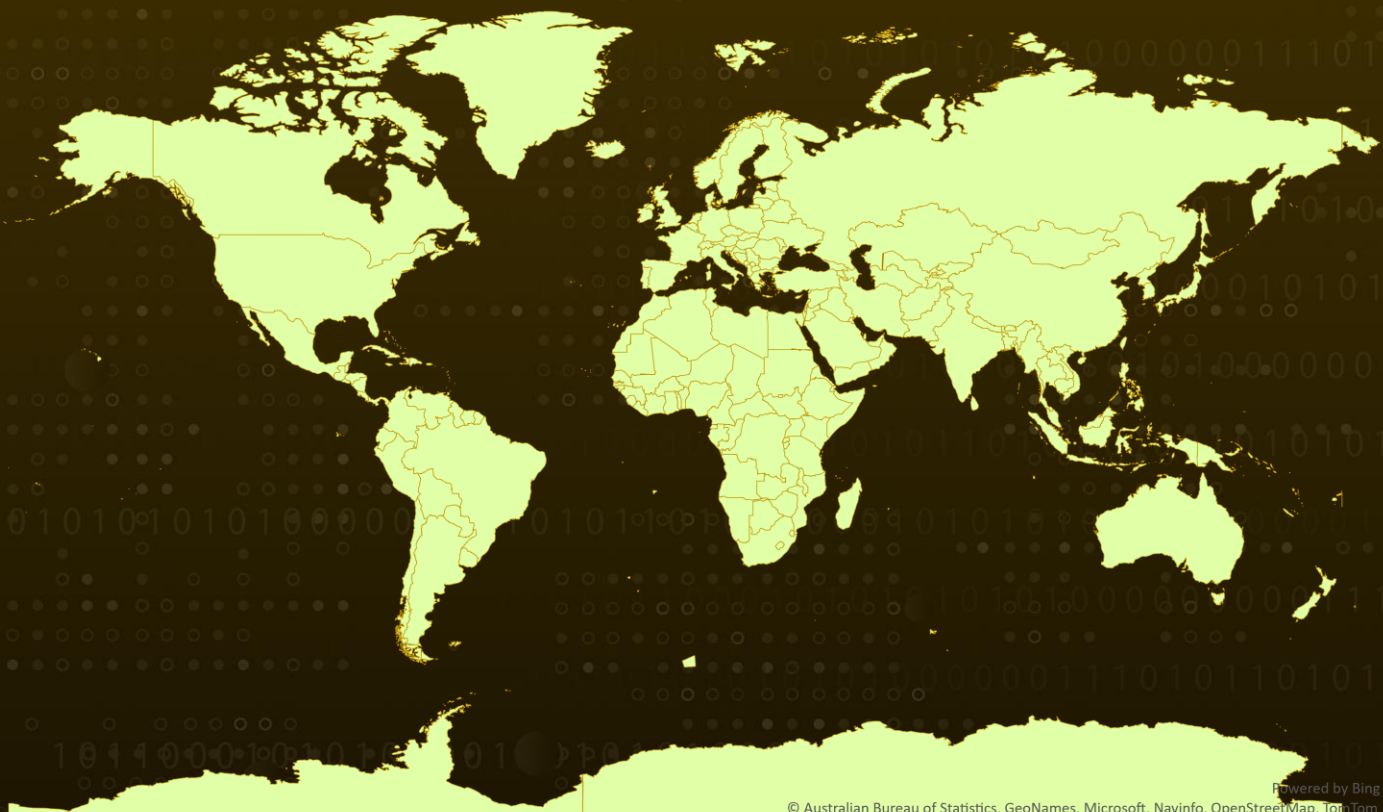

Attack Region: Worldwide

Malware: GoBruteforcer

Affected Products: MySQL, phpMyAdmin, FTP, and Postgres.

Attack: The GoBruteforcer malware targets web servers and uses Golang programming language. It employs CIDR block scanning to access servers through brute force and deploy an IRC bot with the attacker's URL.

Attack Regions

Attack Details

#1

A new Golang-based malware called GoBruteforcer has been discovered, which targets web servers running phpMyAdmin, MySQL, FTP, and Postgres services. It uses the Golang programming language, which has become increasingly popular with malware programmers.

#2

The malware uses a Classless Inter-Domain Routing (CIDR) block to scan a network, allowing access to a wide range of target hosts on different IP addresses within the network, instead of using a single IP address as a target. The malware has an IRC bot that communicates with the attacker's server and deploys a PHP web shell to query the victim system.

#3

The malware is mainly targeting Unix-like (*nix) platforms, with versions for x86, x64, and ARM architectures. The malware is in active development, and initial infection vectors or payloads may change in the future.

Recommendations

Security Leaders

Phishing simulations and routine education and awareness training and communications rarely account for MFA fatigue and web browser hygiene. Integrate and communicate all lessons learned.

Security Engineers

- **Uni5 Users:** This is an actionable threat advisory in HivePro Uni5. Prioritize and block all indicators attributed to the threat actors and attacks through your Command Center. Test your controls with Uni5's Breach & Attack Simulation.
- **All Engineers:** Refer to and action upon the 'Potential MITRE ATT&CK TTPs' & 'Indicators of Compromise (IoC)' on the following pages.
