

THREAT ADVISORY

**ATTACK
REPORT**

Iranian threat actor targets the Albanian government using ROADSWEEP ransomware.

Summary

A cyberattack that took place in mid-July momentarily disrupted various Albanian government services and websites and was most likely the work of Iranian hackers. The attack used a new ransomware family called ROADSWEEP, an unknown backdoor CHIMNEYSWEEP and a new variant of the ZEROCLEAR wiper.

Technical Details

#1

The Roadsweep ransomware code is associated with the Chimneysweep backdoor, which permits adversaries to take screenshots, log keystrokes, and steal files. The malware has been used in attacks against Farsi and Arabic speakers and the MEK (Mujahedeen-e-Khalq/ People's Mojahedin Organization of Iran) organization.

#2

The ROADSWEEP ransomware tool enumerates files on the device and encrypts the content in blocks using RC4. It has a couple of embedded scripts that are used to either run commands or delete the traces of malware from the victim's device as a defensive evasion tactic.

#3

On executing, ROADSWEEP will encrypt all files on the specified system drive and rename the encrypted files with the ".lck" extension. Eventually, a ransom note with a political theme named "How To Unlock MyFiles.txt" is left behind.
